Your Vision. Your Wealth. Your Life.

Setting the Stage ...

- The objective of fixed income in a portfolio
- The realities of the bond market
 - Equilibrium
 - Yield and risk are related

The Sources of Risk in Bonds

- Credit quality of the issuer
- Bond term (the duration of the bond)
- The current interest rate environment
 - Market psychology
 - Supply and demand

And on Wall Street today the markets generated another exciting day's worth of meaningless white noise

Bond pricing relationships

- Bond price and yield are inversely related
- Long bonds are more sensitive to changes in the interest rate environment
- Interest rate risk is inversely related to a bond's coupon rate
- As maturity increases, price sensitivity to changes in yield slows

Price and yield are inversely related ...

10-Year bond at 2.2%

YTM	2.20%	3%	4%	1.50%
Price	\$1,000	\$932	\$854	\$1,065
Difference	n/a	-\$68	-\$146	\$65
Change		-6.8%	-14.6%	6.5%

Calculation assumes a single annual interest payment. Duration is treated as equal to bond maturity (figures rounded)

www.MosaicFP.com

Long bonds have greater sensitivity to interest rate changes

10-year bond 2.2% coupon:

YTM	2.2%	3%	4%	1.5%
Price	\$1,000	\$932	\$854	\$1,065
Difference	n/a	-\$68	-\$146	\$65
Change		-6.8%	-14.6%	6.5%

20-year bond 2.5% coupon:

YTM	2.5%	3%	4%	1.5%
Price	\$1,000	\$926	\$796	\$1,172
Difference	n/a	-\$74	-\$204	\$172
Change		-7.4%	-20.0%	17.0%

Calculation assumes a single annual interest payment. Duration is treated as equal to bond maturity (figures rounded).

www.MosaicFP.com

Interest rate risk is inversely related to a bond's coupon rate

All things equal, higher coupon bonds are less sensitive to increases in interest rates

What is the price impact of a 1% increase in YTM on bonds having different coupon rates? (20-year bond)

Coupon	2.0%	3%	4%	5%	6%
Price	\$851	\$864	\$875	\$885	\$894
Change	-14.9%	-13.6%	-12.5%	-11.5%	-10.6%

Calculation assumes a single annual interest payment. Duration is treated as equal to bond maturity (figures rounded).

www.MosaicFP.com

As maturity increases, price sensitivity to changes in yield increases at a progressively slower rate

What is the price impact of a 1% increase in YTM on bonds having different coupon rates?

(3% coupon bond)

Term	5-year	10-year	15-year	20-year	30-year
Price	\$955	\$919	\$889	\$864	\$827
% Change	-4.5%	-8.1%	-11.1%	13.6%	-17.3%

Calculation assumes a single annual interest payment. Duration is treated as equal to bond maturity (figures rounded).

www.MosaicFP.com

Defining Duration ...

- A measure of a bond's effective maturity. This is the time required for full repayment of the bond at the bond's stated yield.
- Duration is the sum of the PV of payments (both coupon and bond redemption) weighted for their relative importance to repayment.

www.MosaicFP.com

Duration as a measure of risk

- Duration is a proxy for volatility
- For each 1% movement in yield – duration measures the approximate percentage change in bond price
- Example – a bond portfolio with a duration of 8 years could be expected to rise or decline in value by 8% for every 1% change in yield
- All other factors equal, bonds of longer duration will experience greater volatility

Bond portfolio strategy

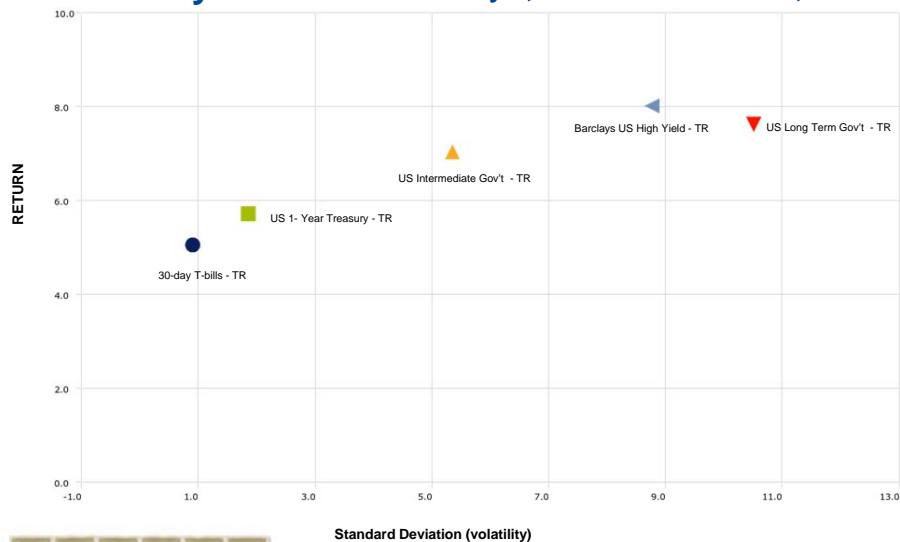

- Eliminate or substantially reduce the use of long term bonds
- Employ both intermediate and short term bonds in your bond allocation. Consider some allocation to other bond sectors (mortgage, foreign, TIPs)
- Given the volatility of high yield, consider replacing high yield with equity to enhance growth characteristics.
- Review and monitor portfolio duration
